

Little Horn Clean Boost Pedal

Instruction Sheet

Hello!

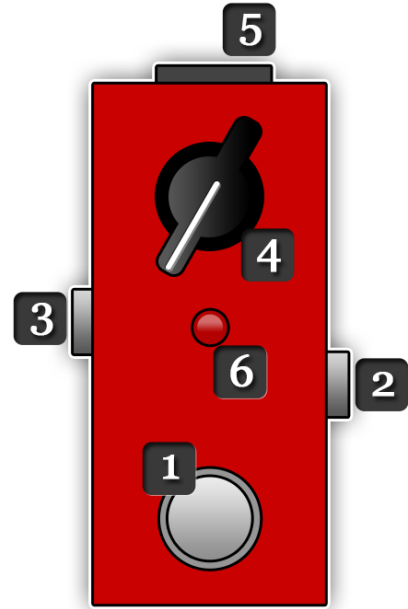

Thank you for purchasing your Little Horn Clean Boost Pedal from Vein-Tap.com. It's a terrifying little beast and we're sure you're going to have an awesome time experimenting with the sounds this simple beauty has to offer. To the right is a diagram of the Little Horn: all the points are explained below.

Remember this is an absolute volume monster, especially for clean amps and in FX loops, so be sure to turn this all the way down when you first use it and slowly dial in the amount of boost you need. We made this little fella loud. Respect him.

Thanks again, and enjoy your Little Horn Clean Boost Pedal!

Ben

Vein-Tap.com

1. Bypass footswitch. Turn the effect on and off here. The Little Horn is wired with true bypass, so when the pedal's disengaged, all circuitry is kept entirely out of the signal path.
2. Input. Plug your previous pedal or guitar in here.
3. Output. Connect your amp, or next pedal in your chain, here.
4. Boost knob. This controls how much the signal will be boosted. This goes from 0 (unity, the same volume as your guitar) to +24dB.
5. Power in jack. Use a standard, 9v, 2.1mm centre negative power jack here.
6. LED. This will light when the effect is engaged, and turn off when the effect is disengaged.
